

EIP-8025 - Prysm update

Manu

PRYSM

By Offchain Labs

Done so far:

- [Initial POC](#) done by **Jun Song** and **@developeruche**
- Currently adapting the code base to the latest specification
(post [Refactor EIP-8025 specs PR](#)) - Target EOW without proof signature

- To help testing, implemented a standalone golang [dummy prover](#)
(Inspired from the one integrated in LH done by Kev)

The prover listens to Beacon blocks from SSE event from the source beacon node

The prover publishes the (signed soonTM) proofs to the target beacon node via the **/eth/v1/prover/execution_proofs** beacon API

```
1 dummy-prover -source-beacon-node http://0.0.0.0:34177 -target-beacon-node http://0.0.0.0:34177 -proofs-per-block 4 -proof-delay-ms 500
